In the Claims:

The claims are as follows.

1. (Previously presented) A data communication method that compensates for disadvantageous characteristics of a first protocol that is used to communicate data between a client application and a server application, wherein the client application and the server application complay a second protocol that is mapped onto the first protocol, said method comprising the acts of:

intercepting, by a client interceptor acting on behalf of a server application, a secondprotocol data communication request from a client application;

mapping, by the client interceptor, the second-protocol data communication request onto the first protocol;

sending the communication request to a server interceptor using the first protocol; compensating a disadvantageous characteristic of the first protocol, said compensating comprising ascertaining that a condition exists and eliminating the condition in response to said ascertaining, said condition being a connection condition or a transmission capacity condition;

mapping, by the server interceptor, the communication request back onto the second protocol to recreate substantially the second-protocol data communication request; and delivering the second-protocol data communication request to the server application.

2. (Previously presented) The method of claim 1, wherein the ascertaining comprises determining loss of a connection, and wherein the eliminating comprises re-establishing the connection.

- 3. (Previously presented) The method of claim 1, wherein the ascertaining comprises detecting that a connection is idle, and wherein the eliminating comprises dropping the connection and reestablishing the connection when a new communication request is intercepted.
- 4. (Previously presented) The method of claim 1, wherein the ascertaining comprises determining that transmission capacity is insufficient to process the data communication request within a predetermined interval of time, and wherein the climinating comprises establishing a parallel connection to increase transmission capacity.
- 5. (Original) The method of claim 1, wherein the second protocol is connection oriented, and wherein the client interceptor and the server interceptor intercept a plurality of connections between the client application and the client interceptor using the second protocol, and between the server interceptor and the server application using the second protocol.
- 6. (Original) The method of claim 5, wherein the plurality of connections using the second protocol are multiplexed onto a single connection of the first protocol.
- 7. (Original) The method of claim 1, wherein the first protocol is a wireless communication protocol.
- 8. (Previously presented) The method of claim 1, further comprising the act of opening, by the client interceptor, a connection to the server interceptor using the first protocol following the act

of intercepting the second-protocol data communication request.

9. (Previously presented) A data communication method that compensates for disadvantageous characteristics of a first protocol that is used to communicate data between a client application and a server application, wherein the client application and the server application employ a second protocol that is mapped onto the first protocol, said method comprising the acts of:

intercepting, by a client interceptor acting on behalf of a server application, a secondprotocol data communication request from a client application;

mapping, by the client interceptor, the second-protocol data communication request onto the first protocol;

sending the communication request to a server interceptor using the first protocol; compensating a disadvantageous characteristic of the first protocol;

mapping, by the server interceptor, the communication request back onto the second protocol to recreate substantially the second-protocol data communication request;

delivering the second-protocol data communication request to the server application; opening, by the client interceptor, a connection to the server interceptor using the first protocol following the act of intercepting the second-protocol data communication request; and receiving, by the client interceptor, an identification of the server application; and forwarding the identification to an address-resolution server for first-protocol address resolution.

10. (Previously presented) The method of claim 1, wherein the client application and the client 09/855,360

interceptor reside on a same computing device.

11. (Previously presented) A data communication system that compensates for disadvantageous characteristics of a first protocol that is used to communicate data between a client application and a server application, wherein the client application and the server application employ a second protocol that is mapped onto the first protocol, said system comprising:

a client interceptor acting on behalf of the server application, said client interceptor adapted to intercept a second-protocol data communication request from the client application, said client interceptor further adapted to map the second-protocol data communication request onto the first protocol;

a server interceptor adapted to map the communication request back onto the second protocol to recreate substantially the second-protocol data communication request;

means for sending the second-protocol data communication request to the server interceptor using the first protocol;

means for compensating a disadvantageous characteristic of the first protocol, said compensating comprising ascertaining that a condition exists and eliminating the condition in response to said ascertaining, said condition being a connection condition or a transmission capacity condition; and

means for delivering the second-protocol data communication request to the server application.

12. (Previously presented) The system of claim 11, wherein the ascertaining comprises determining loss of a connection, and wherein the climinating comprises re-establishing the

connection.

13. (Previously presented) The system of claim 11, wherein the ascertaining comprises detecting that a connection is idle, and wherein the climinating comprises dropping the connection, and re-cetablishing the connection when a new communication request is intercepted.

14. (Previously presented) The system of claim 11, wherein the ascertaining comprises the acts of determining that transmission capacity is insufficient to process the data communication request within a predetermined interval of time, and wherein the climinating comprises establishing a parallel connection to increase transmission capacity.

15. (Previously presented) The system of claim 11, wherein the second protocol is connection oriented, and wherein the client interceptor and the server interceptor are adapted to intercept a plurality of connections between the client application and the client interceptor using the second protocol, and between the server interceptor and the server application using the second protocol.

16. (Previously presented) The system of claim 15, wherein the plurality of connections using the second protocol are multiplexed onto a single connection of the first protocol.

17. (Previously presented) The system of claim 11, wherein the first protocol is a wireless communication protocol.

18. (Previously presented) The system of claim 11, further comprising:
